Ashoverite  $Zn(OH)_2$ 

©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Tetragonal. Point Group:  $4/m \ 2/m \ 2/m$ ,  $\overline{4}2m$ , or 4mm. Crystals are square plates, to about 0.5 mm, which thin markedly toward their edges; commonly in stellate groups of crystals intersecting at angles of  $60^{\circ}-70^{\circ}$ .

**Physical Properties:** Cleavage: Perfect on  $\{001\}$ . Hardness = n.d. D(meas.) = 3.3 D(calc.) = 3.44 Fluoresces bluish white under SW UV.

Optical Properties: Translucent. Color: Colorless to milky in the center of crystals.

Streak: White. Luster: Dull to vitreous.

Optical Class: Uniaxial (+).  $\omega = 1.629(2)$   $\epsilon = 1.639(2)$ 

**Cell Data:** Space Group:  $I4_1/amd$ ,  $I\overline{4}2d$ , or  $I4_1md$ . a = 6.825(2) c = 33.36(4) Z = 32

X-ray Powder Pattern: Near Ashover, England.

2.902 (100), 1.819 (33), 1.702 (21), 1.470 (19), 3.031 (13), 1.0063 (13), 3.332 (11)

## Chemistry:

	(1)	(2)
ZnO	84.46	81.88
PbO	2.06	
CdO	0.71	
CaO	0.15	
${\rm H_2O}$	14.9	18.12
Total	102.28	100.00

(1) Near Ashover, England; by electron microprobe, average of eight analyses;  $H_2O$  by CHN analyzer, thought to lose  $H_2O$  under the electron beam; on recalculation to 2(OH,O) corresponds to  $(Zn_{1.18}Pb_{0.01}Cd_{0.01})_{\Sigma=1.20}[(OH)_{1.60}O_{0.40}]_{\Sigma=2.00}$ . (2)  $Zn(OH)_2$ .

Polymorphism & Series: Trimorphous with sweetite and wülfingite.

Occurrence: In an oxidized vein in limestone (near Ashover, England).

**Association:** Sweetite, wülfingite, fluorite (near Ashover, England).

**Distribution:** In a limestone quarry 200–300 m northwest of Milltown, near Ashover, Derbyshire, England. From Jüliushutte, Astfeld, Harz Mountains, Germany, in slag.

Name: For the locality at Ashover, England, where it was first found.

Type Material: The Natural History Museum, London, England, 1982,5.
