Boothite $CuSO_4 \cdot 7H_2O$

© 2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. *Point Group:* n.d. Crystals very rare, complex, typically fibrous or crystalline massive.

Physical Properties: Cleavage: $\{001\}$, imperfect. Fracture: Uneven. Tenacity: Brittle. Hardness = 2–2.5 D(meas.) = 1.94 D(calc.) = n.d. Soluble in H_2O ; dehydrates to chalcanthite.

Optical Properties: Transparent to translucent. *Color:* Blue; pale blue in transmitted light. *Luster:* Vitreous, silky or pearly if fibrous.

Optical Class: Biaxial (-) or (+). Orientation: $Y = b; X \simeq c.$ $\alpha = 1.47$ $\beta = 1.48$ $\gamma = 1.49$ 2V(meas.) = Large.

Cell Data: Space Group: n.d. Z = n.d.

X-ray Powder Pattern: n.d.

Chemistry:

	(1)	(2)
SO_3	28.65	28.02
FeO	0.28	
CuO	28.53	27.84
MgO	trace	
$\rm H_2O$	43.76	44.14
Total	101.22	100.00

(1) Alma mine, California, USA. (2) $CuSO_4 \cdot 7H_2O$.

Mineral Group: Melanterite group.

Occurrence: An alteration product of chalcopyrite (Alma mine, California, USA).

Association: Chalcanthite, melanterite, pisanite (Alma mine, California, USA).

Distribution: In the USA, at the Alma pyrite mine, near Leona Heights, Alameda Co., and from the Penn (Campo Seco) mine, Calaveras Co., California; at the Colusa mine, Butte, Silver Bow Co., Montana. At Sain-Bel, near Lyon, Rhône, France. From the Galaktos district, 15 km southeast of Veria, Greece. At the Tolbachik fissure volcano, Kamchatka Peninsula, Russia.

Name: To honor Professor Edward Booth (1857–1917), American chemist, University of California, Berkeley, California, USA.

Type Material: n.d.
