©2001-2005 Mineral Data Publishing, version 1

Crystal Data: Monoclinic. Point Group: 2/m. Crystals subhedral, to 1 cm, short prismatic, elongated along [001], with {010} and {011}, other faces irregular, and a diamond-shaped cross-section showing {320}. In radiating clusters and long columnar anhedral crystals, intergrown with nitratine; as crusts.

Physical Properties: Fracture: Conchoidal. Tenacity: Brittle. Hardness = 3.5 D(meas.) = 4.24(1) D(calc.) = 4.244 Slowly soluble in cold H₂O; readily soluble in hot H₂O.

Optical Properties: Transparent to translucent. Color: Colorless to bright yellow; colorless to very pale yellow in transmitted light. Luster: Vitreous. Optical Class: Biaxial (–). Orientation: $X \wedge c = -47^{\circ}$; Z = b. Dispersion: r < v, moderate to

Optical Class: Blaxial (-). Orientation: $X \wedge c = -4T^{\circ}$; Z = b. Dispersion: r < v, moderate to strong. $\alpha = 1.772 - 1.779$ $\beta = 1.795 - 1.802$ $\gamma = 1.817 - 1.824$ $2V(\text{meas.}) = 86^{\circ} - 96^{\circ}$

Cell Data: Space Group: $P2_1/c$. a = 8.509(1) b = 10.027(2) c = 7.512(1) $\beta = 95^{\circ}16.00(55)'$ Z = 4

X-ray Powder Pattern: Pampa Pique III, Chile. 3.051 (100), 3.238 (90), 4.235 (80), 3.739 (60), 3.503 (60), 2.522 (60), 1.7768 (60)

Chemistry:

	(1)	(2)
I_2O_5	81.4	81.83
CaO	14.1	13.75
SrO	0.4	
H_2O	4.1	4.42
Total	[100.0]	100.00

Pampa Pique III, Chile; after deduction of 1/3 admixed lautarite, CO₂ 0.1%, insoluble 0.3%.
Ca(IO₃)₂•H₂O.

Occurrence: In veins with nitratine and impregnating the enclosing decomposing rhyolite tuff in a small basin filled with nitrate caliche.

Association: Nitratine, anhydrite, lautarite, hydroboracite, halite.

Distribution: At Pampa Pique III, about one km north of Oficina Lautaro, Taltal district, Antofagasta, Chile.

Name: To honor Professor Juan Brüggen (1887–1953), University of Chile, who wrote the first textbook on the geology of Chile.

Type Material: National Museum of Natural History, Washington, D.C., USA, 122445.
