$$
\text { (c)2001-2005 Mineral Data Publishing, version } 1
$$

Crystal Data: Orthorhombic (by analogy to anglesite). Point Group: n.d. As a very fine-grained incrustation or alteration of fleischerite.

Physical Properties: $\quad$ Hardness $=$ n.d. $D($ meas. $)=$ n.d. $\quad D($ calc. $)=6.67$
Optical Properties: Transparent to translucent. Color: White; colorless in transmitted light. Luster: Silky.
Optical Class: [Biaxial.] $n=1.84-1.85 \quad \alpha=$ n.d. $\quad \beta=$ n.d. $\quad \gamma=$ n.d. 2 V (meas.) $=$ n.d.
Cell Data: Space Group: [Pnma] (by analogy to anglesite). $\quad a=8.47 \quad b=5.38 \quad c=6.94$ Z $=4$

X-ray Powder Pattern: Tsumeb, Namibia; close to anglesite.
2.065 (10), 3.326 (9), 3.003 (9), 4.240 (8), 3.209 (7), 3.794 (6), 3.604 ( 6 )

Chemistry: (1) Tsumeb, Namibia; presence of essential $\mathrm{Pb}, \mathrm{Ge},\left(\mathrm{SO}_{4}\right)^{2-}$ confirmed by qualitative analysis; the composition proposed is that of anglesite with replacement of $1 / 3$ $\left(\mathrm{SO}_{4}\right)^{2-}$ by $\left[\mathrm{GeO}_{2}(\mathrm{OH})_{2}\right]^{2-}$.

Occurrence: Very rare, in an oxidized zone of a polymetallic germanium-bearing sulfide deposit, as an alteration product of fleischerite, perhaps produced by grinding for X-ray analysis.

Association: Fleischerite, mimetite, cerussite, anglesite, plumbojarosite, tennantite, dolomite.
Distribution: From Tsumeb, Namibia.
Name: Honors Professor Tei-ichi Ito (1898-1980), Japanese mineralogist and crystallographer, University of Tokyo, Tokyo, Japan.

Type Material: Technical University, Berlin, Germany, 57/1405; Harvard University, Cambridge, Massachusetts; National Museum of Natural History, Washington, D.C., USA, 162597.
